

- Mambo features a page caching mechanism, which improves performance in sites with heavy traffic.
- A fully-featured WYSIWYG editor is built into Mambo with support for scheduling and Flash content.
- Mambo features Search Engine-Friendly URLs, which help your search engine rankings.
- Mambo also features an Advertisement Manager for displaying and managing the ads that will be displayed on your Web site.
- Different bulletin board systems such as vBulletin, PhpBB, and SMF can be integrated with Mambo.
- Mambo has a large developer and user community ready to help people with Mambo-related queries and problems.

8.4.3 Installation

1. Download the latest version of Mambo from www.mamboserver.com. We recommend using WinRar to extract the tar.gz archive on Windows.
2. Copy the extracted contents to a new folder “mambo”. Place this folder in the “www” directory in C:\Program Files\EasyPHPx-x\.
3. From here on, the installation is pretty simple. Point your browser to <http://localhost/mambo/>. Mambo will run a pre-installation check. If EasyPHP is running, the check will be successful, and you can go ahead and install Mambo!
4. After Mambo runs the pre-installation check, click the Next button at the top of the page. You will now have to enter the server details.
5. Here, under “Host Name”, enter “localhost”, then input your MySQL user name i.e. “root” and leave the MySQL Password field blank. Enter the database name as “mamboadb”. Click Next. If you entered the details correctly, you will be taken to the next step.

The Mambo pre-installation check
