

If you do wish to be warned of critical errors, you can use another setting called “**Error Mode**”. Set the DWORD Value to **0** for no error suppression, **1** for suppressing system errors, and **2** for suppressing all errors.

The “New” Right-Click Command Goes Missing

After a Windows update, the much-used “New” option in the right-click could go missing. This hack will fix it.

Navigate to:

HCR\Directory\Background\shellex\ContextMenuHandlers\
\New

Add the following String Value:

{D969A300-E7FF-11d0-A93B-00A0C90F2719} to the “(Default)” setting under that key. If the “New” key is not present, create it and add the value.

Name	Type	Data
(Default)	REG_SZ	{D969A300-E7FF-11d0-A93B-00A0C90F2719}
HKEY_CLASSES_ROOT\Directory\Background\shellex\ContextMenuHandlers\New		

Display Attributes

This is something *nix folks have had all the time—the Attributes of files and folders. In Windows, if you want to see the file and folder attributes in Detailed View in Explorer, you’ll need to use this hack.

Navigate to:

HCU\Software\Microsoft\Windows\CurrentVersion\Explor
er\Advanced

Set the DWORD Value called **ShowAttribCol** to 1 to enable a spanking new “Attributes” column.

Name	Type	Data
(Default)	REG_SZ	(value not set)
ShowAttribCol	REG_DWORD	0x00000001 (1)
HKEY_CURRENT_USER\Software\Microsoft\Windows\CurrentVersion\Explorer\Advanced
