Each participant in your e-mail loop needs a key.jpg

ters are slipped under your door or into your mail tray. Only those who have the key to the lock of the door (i.e. the private key) can open the door and read the message.

PGP encrypts messages sent from your computer to a designated recipient. The private key of the recipient decrypts the message, which also contains the "session key", that is, the key for that particular mail session, to read the e-mail. In this way, PGP provides a very high level of security.

Hushmail offers free encrypted e-mail

6.5.2 Using PGP

Sending an encoded message using PGP is actually quite simple. If you have the public key of the person you want to send the e-mail
