

landscapes, fog, atmosphere and realistic sunsets, sunrises; eclipses for areas with documented observatories; and standard perspective and wide-angle projection modes.

9.10 TypeFaster

<http://prdownloads.sourceforge.net/typefaster/TypeFaster-v0.4.2-install.exe?download>

This is a useful program for learning touch-typing—not as slick as some paid software, but it’s more than enough to learn the basics. Touch typing is where you use a fixed finger for a particular key—and there’s a resting position for all fingers. In other words, you aren’t supposed to fumbling about all over the place to press a key—you use the “assigned” finger for a particular key, then bring it back to its resting position.

The program has lessons in stages, and it’s very simple to begin with—all you need to do is press the key highlighted on the screen, then bring your finger back to its resting position. It’s all explained in the help file. Naturally, the lessons get tougher and faster as they progress, but it starts off with something as simple as a permutation of [F], [J], and the Spacebar. ([F] and [J] are where the little tabs for resting your index fingers are located.

The key to be pressed is highlighted
