

car that you have, which means that, like we mentioned before, you can race an F1 car against a Rally Championship car.

You can configure your race for length or laps, like 50 kilometres or four laps. It is advisable to practise a bit before you start a race proper, as you'll need to configure the steering sensitivity of your keyboard to suit your driving style. The game allows you to use the keyboard, steering wheel, or mouse.

The F1 car is the fastest you can choose, so if you're one of those who don't like to hang around with the rest of the pack, choose it. The game also allows you to play in split screen mode for multiplayer action right on your own computer. It's totally reminiscent of old 3D arcade games in video game parlours.

F1 vs Rally vs Road... what's the world coming to!

Graphics-wise, the game is no *NFS Most Wanted*. The physics are rather elementary, with a lot of edges and hardly any curves. The F1 car could use a lot of work. The other cars are reasonably well defined—you can make out a Rally car from a NASCAR. They each have fake advertising logos, which is pretty cool, and which could have been spread over the course of the track as well. But hey, this is open source!
