

cation of filter will influence the final results. So if you have a logo filter first (adds a logo to the movie) and a blur filter next (blurs the movie), if carelessly done, you would end up blurring the logo you just applied. So, in this instance, the logo would be the last filter to add.

After all filters have been added, choose **File > Save As AVI** for the job to begin.

Audio Filters can also be applied similarly. They can be accessed under **Audio > Filters** when in full processing mode.

Virtual Dub offers a lot more advanced features than just application of filters. The included help file is extensive in describing how to exploit these.
