

4.1.3 Sodipodi

The inexplicably-named Sodipodi is another alternative for vector illustration, and apart from the way it looks, is much like Inkscape itself—Inkscape, in fact, is a spin-off of the Sodipodi project. Its primary graphics format is also SVG, making it another must-have for web designers.

It runs a bit slower than Inkscape, but its output looks excellent, justifying that extra overhead to some extent. Its one-stop toolbox makes it

Don't let the silly name fool you, Sodipodi is quite capable

Sodipodi's interface starts out quite basic

easy to use, though Inkscape ultimately has better SVG support.

4.1.4 The GIMP

(<http://gimp-win.sourceforge.net/stable.html>)

The GIMP, or GNU Image Manipulation Program, was first released by two Berkeley students in 1996. It has since evolved into a powerful little program; the latest build, GIMP 2.0, has completely revamped its look, and this makes it a legitimate player amongst the mainstream image editors. Installation in Windows is a breeze. The GIMP opens in a smattering of windows littered all
