

sion, go to the directory where you downloaded the file, open a terminal window in the directory, and type at the command prompt: “sh GoogleEarthLinux.bin” and follow the instructions. The default location for the installation is `/usr/local/google/google-earth`, and to launch it, use “`/usr/local/google/google-earth/googleearth`”.

To install on Mac, double-click the Google Earth .dmg file in your downloads directory. You will be asked to confirm the licensing agreement, following which the Google Earth disk image will appear. Double-click the Google Earth disk image to display a new window with the Google Earth globe icon. Place the icon anywhere convenient (recommended: Applications folder or Application dock), and you’re ready to go.

For problems with installing and uninstalling Google Earth, check <http://earth.google.com/support/bin/topic.py?topic=1135>.

8.2 Searching and Navigating

When you first start up Google Earth, it zooms in to a picture of the globe hovering over North America.

From this starting point, you can view any place or location on earth, provided, of course, that the appropriate map data is available. In general, map data for all areas of earth are available, but depending on country and region, the resolution of the images will vary. You have countries and cities where you can enter street-level information, and Google Earth will zoom in to show you an aerial view of the street. Similarly, for certain countries, it can help you find local business locations and give you driving directions between two

locations. The full combination of maps, local business search, satellite imagery, street-level search, and driving directions is currently limited to the following countries: Canada, China, France, Germany, Italy, Netherlands, Spain, the UK, and the US. Other countries have varying levels of data and satellite imagery at different depths of resolution.

To get an idea of Google Earth’s capabilities, you can use the Sightseeing folder to get a “guided tour.” Click on the My Places panel on the left and select the checkbox next to the Sightseeing folder. Click Play. This will start an automated tour from Disney World in the US, taking you on a circuitous route to famous landmarks around the world before ending at the Google Campus back in the US.

Go sight-seeing

Use the “Fly to”, “Find Businesses”, or “Directions” tabs to enter the location you wish to search for. Subject to the limitations of information availability, locations can be searched for by city, country, street number, and postal code. You can also look up location information by using the latitude and longitude co-ordinates.

In the “Fly to” tab, enter the name of a location, and the 3D Viewer will zoom into the location.

To find a business, use the “Find businesses” tab: enter the type of business you are looking for, and limit the search to a spe-
