

Effects enables you to apply various effects. These include things like giving it a sepia tint, rendering it in black and white, giving it a soft focus, and other basic special effects.

Editing - Effects

In addition to the above, you have standard picture rotation controls (clockwise and counter-clockwise) and the ability to undo all your edits.

Also, for photography aficionados, pictures from digital cameras can be imported with camera and colour histogram information (EXIF). This information will be available in the properties of the image (**right-click > Properties**) and can aid in the editing and touching-up of the picture.

One interesting task you can do in Picasa is to make a collage of various pictures. To do this, just select a few pictures and click on the Collage button. You can choose what type of effect it should have, what kind of background, and where it should be stored. Once you make your selections, just click Create. You can now print the collage out, use it as a wall-paper or screensaver, or send it to friends and family!

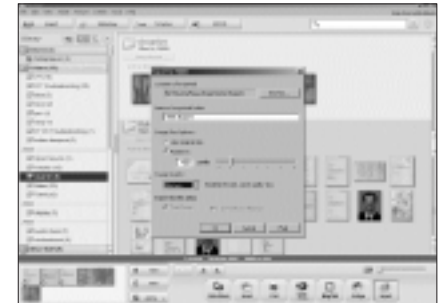

Create a collage

9.5 Exporting Pictures

You can use the Export function to save copies of edited pictures. The Export function enables you to export the files to a different folder location and also enables you to change the quality and size of the exported image copy.

First, select the pictures you want to export. Use the [Ctrl] key to select multiple pictures in the same folder. Click the Hold button at the bottom right corner. Similarly, if required, select other required pictures from other folders. All the pictures that are being “held” will show up in the “holding tray” at the bottom right. Once the selection is complete, click the Export button. This is found at the bottom right corner.

Export your pictures

In the resulting dialog box, specify a folder for the exported file, resize the images to a single size or leave it at its original size, specify the image quality for the files being exported, and click OK.

All the files will be exported and will appear in Picasa with the new resolution and image quality under the designated folder.

Using the above export procedure, pictures can also be exported to hardware devices like memory cards and digital cameras. The only requirement is that they should appear as removable drives under My Computer in the Windows folder structure, when you click on the browse button.

This export function is different from the “Save a copy” function. In the “Save a copy” function, a copy of the edited file is saved along with the original picture in the same folder. There is no facility to save the file to a different folder or to adjust the resolution and image quality.
