

For general connectivity to the Internet and how to use your mobile device's Web browser, ask your mobile service provider and refer the device's user manual respectively. Note that when we say "hit [Enter]" or "click the button" and so on, these correspond to the functions that would normally be done on a PC Web page. Mobile phone browsers may differ in how they handle this functionality, which should be explained in detail in the user manual. Also, be prepared for slower response times than on your PC.

15.2 Preferences and Language Settings

Just like you do through your PC browser, you can set preferences and language settings for your Google mobile interface. At the Google homepage on your mobile browser, scroll through the search box, the search button, the radio buttons, and the other links, till you reach the Preferences link. Hit [Enter] and adjust your language and safe search settings.

15.3 Web search

Google Web search via your cell phone or PDA is nearly the same as searching on your computer, but there are some differences. The obvious one is size. Google does a good job of intelligently taking the standard HTML content of the Web and re-formatting the search results for easy readability and intuitive navigation, depending on the screen size you have.

Type in your search term, highlight the Search button and hit [Enter]. Up to ten search results are displayed per page. You can use all the search operators that you would normally use with PC Web search to refine your results.

15.4 Image search

To search images, type in search term, scroll down, and highlight the Images radio button. Then scroll back, select the Search button, and hit [Enter]. Similar to Web search and supporting all the search operators that you use with PC image search, Google Image Search on your mobile is streamlined for fast display. Up to three images are displayed for each page of results.

15.5 Mobile Web search

Similar to regular Web search but restricted to content available on mobile-ready sites only, type in your search term, scroll down to select the Mobile Web radio button, scroll back to select the Search button, and hit [Enter].

15.6 Froogle search (Labs)

This product is still in the cooking at Google Labs, but you can see what it's capable of now by going to <http://wml.froogle.co.uk>.

15.7 Google News

Access Google News by scrolling down on the homepage, selecting the News link and hitting [Enter]. This will open the News homepage. You can use the search box for specific topics, or read the first headlines of the Top Stories section. Clicking on an article link will take you to the Web site with the news story where you can read the full story. You can also scroll down and select the links that will take you to other items like all the top stories; you can expand the other sections like Nation, World, Entertainment etc. (see the chapter on Google News for details), or click on any of the sections to get more stories from each section.
