

page on the site is superimposed with the gathered data about the clicks on each link on the page. This makes it much easier to identify performing links, and figuring out reasons behind it.

GA presents geographical data in the simplest way possible—on an atlas. This makes it easy to see the visitors' physical location, and use that information to better target those locations giving the most sales. Google calls this “Geotargeting.”

Geotargeting your site

Relevance

AdWords has been deliberated upon in an earlier chapter, so readers are aware of the practice of “buying keywords.” Briefly, it means that advertisers pay an ad service provider like Google to display their ad every time someone searches for the keyword on their search engine; or someone visits a site containing a high recurrence of the keyword. Since GA doesn’t only track keywords associated in the AdWords programme, but also those from other programs, and even other marketing efforts like affiliate marketing, e-mail newsletters, banner ads, etc. a broad perspective of online ad effectiveness can be arrived at.

For a marketer, knowing which keyword is bringing in most traffic would enable reducing spending on buying other keywords. For example, say a travel site buys “airplane” and “holiday.” If the GA report shows that 90 per cent of those coming to the site are contributed by ads based on “holiday,” the company can stop investing in the “airplane” keyword.
