

The name refers to the program's ability to undo browser hijacking. Besides this, HijackThis also bundles along a few useful anti-spyware tools. A Hosts file editor is one of them. HijackThis also tags along a process manager, which is just like the Windows Task manager—except it also shows the DLLs linked to each process. Files that resist deletion can be removed by setting HijackThis to delete a file during the next reboot, but this is limited to a single file deletion. Unlocker, as mentioned earlier, can help.

4.5.3 WinPatrol (www.winpatrol.com)

This anti-spyware application, once installed, prevents any malware from modifying system files and IE features. Areas of the system like the startup list, Hosts file, and active processes are displayed by WinPatrol, allowing the user to edit entries or stop a process.

4.6 File Recovery Tools

Data loss is the result of personal errors or hardware failure. Personal error accounts for deleted files and partitions; hardware failure results in bad sectors. The location of the bad sector influences the kind of data lost—if the bad sector occurs in data storage areas, then only files are lost, but if a bad sector appears in the system areas, causing an error in the partition table, an entire partition is usually lost.

Recovery tools need to be used cautiously, and should never be installed on the same drive that contains the files to be recovered. Ideally, the drive containing the deleted files should not be used for booting, since during this process, Windows writes to the disk. It is best to use the drive in another system for best chances of file
