

one data series. Also, the space between the charts can be used to fill in information about the chart. Of the two types available, one is a regular doughnut, while the other is an exploded depiction.

Doughnut charts

6.2.7.4 The Bubble chart

This is similar to an XY chart, where sets of three values of data are displayed with differently-sized bubbles plotted like a scattered chart and an area chart. The drawback of this type of chart is, if there is a lot of data, the bubbles might overlap. Two sub-types are available, basically letting you display the bubbles as 2D or 3D.

Bubble charts

6.2.7.5 Radar chart

For relative comparison among items, the Radar Chart is a good option. Using a radar chart, changes in data can be shown by relative mapping of data on the axis from a centre point. The radar chart has three sub-types—Lines, Markers, and Fill. The Lines type connects different data series with lines; Markers will place dots at corresponding points, and the Fill will just fill a colour in the areas covered by each data series.

6.3 Creating And Customising A Chart

To make a chart, follow these steps.

1. After feeding the data into the worksheet, select the range of data you wish to chart. Go to Insert, and you will see the Charts
