

group. Here, select the type of chart you want to create. Then choose the sub-type and the style.

2. Next, make sure that the data range you want to plot is charted along the appropriate axis. You can change the data range on either axis—vertical (X-axis) or horizontal (Y-axis). To perform this function, select either vertical axis or horizontal axis on the chart area. To perform this function, select Chart from the Design tab; in the Data Group, click on Select Data to display the Select Data Source dialog box and right-click to choose the Select Data option. Select Data Source. A dialog box will pop up.
3. If you wish, you can switch the view of the data to be charted from Rows to Columns of the worksheet at the Select Data Source dialog box. If you've know your formulas, you can manually feed the data range in the Chart Data Range box. Click OK to see the new chart.
4. You can now name the Chart Titles, and the data sets on the X, Y, and Z axes. The axes can be further customised.
5. From the Gridlines option, add/remove Gridlines across all axes.
6. Place a legend at the top, bottom, corner, or left or right side of the chart.
7. For Data Labels, see §6.5.
8. If you want to show the Data Table on the chart, select the Data Table checkbox.

6.4 Formatting Chart Elements

Once you've made your chart, you can begin formatting the elements: Either use the Format tab located under the Chart Tools tab, or you can select a Chart element, right-click, and select Format.
