

3. WordArt Styles

For text formatting, choose the appropriate buttons from the WordArt Styles options. You can choose the Shape Styles More to select colour, Shape Fill to fill colour in the box, Shape Outline for a new outline colour, and Shape Effects to add effects to the Text to the Chart Title.

4. Arrange

Using this tab group, you can arrange your selected objects located on the Chart. It has three options—Selection Pane, Send to back, and Bring to front. Choose the Selection Pane option and it will appear to the left of the worksheet if you want to view the selected objects and change their order and visibility. Also, you can bring the selected object to front or send it to the back by using the Bring to Front and Send to Back options.

5. Size and Properties

Using the Size tab group, you can specify the size and positioning of the object and specify alternative text. The height and width of the chart can be set using the options listed. Alternative text can be added if required.

6.4.1 Formatting Elements

To format almost anything in a chart, just select it, right-click, and click Format. A dialog box to Format Chart Area / Chart Titles / Legend / Plot Area / etc., will appear with formatting options. Here, you can choose to Fill with solid colours or a gradient, change border colours, border styles, add shadows, 3D effects, and change alignments.

6.4.2 Formatting Category Axes

Click to select an axis and then right-click and select “Format Axis...”. Here you will be able to modify the intervals between Tick marks (each measurement point on the axis), the interval between labels, the label distance from the axis, the axis type (data or text), Major and Minor tick marks, axis labels, vertical axis crosses and the position of the axis.
