

3. Right-click on the data series in the Fields list to add to Report Filter, Legend Fields, Axis Fields, or Values.

To sort the data series listed in the PivotTable Field List, hover the cursor over it and you will see a small arrow. Click on this for more sorting options. The PivotTable Field List can be customised by ticking the different options listed on the top of PivotTable Fields List. After you've customised the options in the PivotTables Field List, right-click on the PivotChart and select Refresh Data. You can find the changes you made (if any) in the PivotTable Fields List on the PivotChart.

Re-arranging a PivotChart

If you want to make life easier, move the PivotChart to the same worksheet as the corresponding PivotTable. From the PivotChart Tools Tab, click on Design, and select Move. Go to **Move Chart > New Sheet**. Click OK and open the new chart sheet with your PivotChart. The drop-down list of the PivotChart Filter options can be used to represent data any way you want. Choose one of the two drop-down buttons available: **Axis Fields** filter the categories charted along the vertical axis, while **Legend Fields** filter the data series shown in columns, bars or lines in the chart body identified by chart legend.

Formatting a PivotChart

Although PivotCharts are created from PivotTables, formatting a PivotChart is almost identical to the process with a regular chart. Just use the Design Tab to select the chart type and the sub-type. The Layout of the PivotChart can be customised by changing Chart Titles, Text Boxes, and Gridlines. Use Format to change the look of the graphics and the background. You might find a few options missing while formatting PivotCharts.
