

You can probably guess the difference between each of these. When the macro is stored in the current workbook or in a different workbook, it'll only work when that respective workbook is open; if it's stored in the "globally accessible" PERSONAL.XLSB, it'll be accessible from any workbook—which means that whatever workbook you open, you can press the shortcut keys and the macro will work. This is what you'll probably be using most often.

At the point of creation of the macro, you specify its name, and what the keyboard shortcut will be. Shortcut keys can be [Ctrl] along with a letter (from A through Z), or [Ctrl] + [Shift] along with a letter. No other types of names are allowed, such as [Ctrl] + [Alt] + [-].

The View tab on the Ribbon has a Macros command button, upon pressing which a drop-down menu with the following three options comes up:

The Macros menu appears at the end of the View Tab

- ➡ **View Macros:** This will open the Macro dialog box, where you select a macro to run or edit.
- ➡ **Record Macro:** This will open the Record Macro dialog box, where you define the settings for a new macro and then start the macro recorder.
- ➡ **Use Relative References:** When this is depressed, Excel will, of course, use relative references when recording the macro. This is
