

7.3 Recording And Using Macros

When you turn on the macro recorder—say from the Developer tab—you’ll need to first press Start Recording, and choose whether you want to use relative cell references. Then do whatever you need to be recorded. For example, you could choose to enter 23, 34, and 35 in a range of cells, then sum them up. But before you do this, it’s a good idea to give the macro a name more descriptive than “Macro1”. You cannot use spaces in the name, and the name must begin with a letter. Next, you enter the shortcut key, which is pretty intuitive—except for the small fact that you shouldn’t overwrite inbuilt functions by, say, using [Ctrl] + [V] (paste) as a shortcut. Next, select what location to store the macro in, the options for which we’ve already talked about.

Now for the actual task. Press “Start Recording”, and do what you need to be recorded—say entering three numbers and summing them, or inserting text at a particular font size and with a certain formatting. Click “Stop Recording” when you’re done. Your macro should work when

The Record Macro dialog box

you next use the shortcut key. You can also view all your macros by doing any of the following (and then you can run them):

Under the Developer tab, you have the Macro options
