

- Click the View Macros option on the Macros command button on the View tab.
- Click the Macros command button on the Developer tab of the Ribbon.
- Press [Alt] + [F8].

After any of these three actions, Excel will open the Macro dialog box. It will list the names of all the macros in the current workbook and in your Personal Macro Workbook. Click the name of the macro you want to run and click the Run button (or press [Enter]).

The Macro dialog box. You'll use this often

A point to remember when running a macro is that if you run it in a worksheet that already contains some data in the cells that the macro modifies, you could lose the existing data. Why worry—just undo by pressing [Ctrl] + [Z], right? The problem is that a macro is not a single action: there are several steps that Excel performs while running the macro, depending on how complex the macro is. As a result, you might need to undo many times to undo the action of the macro.
