

7.4 The Visual Basic Editor

If you want to see the code of a macro you entered, you'll need to open its "code" window—open the Visual Basic Editor by pressing [Alt] + [F11], then from the left, double-click the appropriate "module" that contains the code, and the code window will come up on the right. (We won't go into what Modules are, because you won't need it right now.)

You create a lot of such code when you record a Macro!

Like we said, any macro you record gets stored as VBA code. What we're telling you now is, you don't necessarily need to record a macro: you can write it out directly. Here is an example of how you can write a macro entirely in the VBA editor. We're including this here just so you can feel comfortable with what's going on, and what on earth the VBA editor is!

To keep track of what you've written, use comments. Anything you type in after a single quote will appear green in the VBA editor, and it will be ignored when the macro is running.
