

So here goes: open the VBA editor by pressing [Alt] + [F11]. Then go to the Project Explorer at the top left, and select “VBAProject”. There, right-click and insert a “Module”, or go to “Module 1” (for example) if it’s already there.

You might see a couple of macros already in the code window at the right. Remember that macros start with “Sub” and end with “End Sub”, and then you can place your macro text anywhere you want—for example, after one “End Sub” that’s already in the module.

Now, the following code will copy a range of cells and paste them in the current cell:

```
'This is my first macro
Sub CopyARange() 'This is the name of the macro
Range("C24:C35").Copy Destination:=ActiveCell
'To-do: Get help on what ActiveCell and .Copy are
End Sub
```

The lines that begin with a single quote are ignored. The range here is C24 to C35. You run the macro using the procedure we already described.

For another simple example, here’s how to fill cells D1 through D4 with the squares of the numbers beginning from 5—that is, 25, 36, 49, and 64. This code requires you to go through several numbers—four of them—so we use what is called a “for loop”:

```
Sub Squares()
For x = 5 To 8
Cells(x, 4).Select
Selection.Value = x^2
Next x
End Sub
```
