

```
.FontStyle = "Regular"  
.Size = 14  
.Strikethrough = False  
.Superscript = False  
.Subscript = False  
.OutlineFont = False  
.Shadow = False  
.Underline = xlUnderlineStyleSingle  
.ColorIndex = 53  
End With  
End Sub
```

Now what do all the above mean? It's easy to see that you can edit the size to be something other than 14; it's easy to see that you can edit the font to whatever you want. "ColorIndex", too, can be played around with. But for all the rest, you'll need to use Excel's inbuilt help. Like, what is "OutlineFont"? What is "Shadow"?

At this point, we can tell you three things:

1. Play around with the macros (subroutines). In our text example above, position the cursor somewhere other than cell A1 and see what happens. It prints out the text without the formatting. Why? Go figure—literally! Learn by experimentation.
2. If you're not the experimentative kind, create the macros you're most likely to use, then use the inbuilt help for each small thing. You should get the hang of it soon enough—at least enough for you to be able to edit your own macros.
3. If you want to write your own macros for all kinds of stuff: we hate to tell you this, but VBA is a vast topic—we could use a couple of *Fast Track* editions just for that! For now, download Microsoft's *Office 2003 Editions: Excel VBA Language Reference*, if you're interested, from www.microsoft.com/downloads/details.aspx?familyid=2204a62e-4877-4563-8e83-4848dda796e4&displaylang=en (<http://tinyurl.com/56rj5>).
