

ing it manually or by referring to a cell reference or a cell range reference. There are two ways of entering arguments in the Function arguments window—manually or by selection. For manual entry, you

Manual or Drag-and-Select entry of function arguments

type in the cell reference or values directly into the Function Arguments box, or you can have Excel automatically fill in the reference for you. To do that, click inside in the field where you want to fill in the references automatically. Move the Function Arguments window to the side till you are able to select your cell range. Drag and select the cell range that contains the values you need. The range reference will be automatically entered into the selected field.

Some arguments require special formats for them to use the arguments. For example, functions in the Date & Time category may require that date arguments be specified in calendar form and not numerically.

Some functions may not have arguments. For example, the function “=PI()” will show the result of Pi to 15 decimal points. Likewise, the function “=TodayTODAY()” will show the current date. In both these cases, no additional arguments are involved. However, note the opening and closing brackets. Whether there are arguments or not, these brackets are compulsory and follow the function name.

9.2 Logical Functions

Excel has seven logical functions: AND, FALSE, IF, IFERROR, NOT, OR, TRUE. All these functions, except for the IFERROR function, will
