

European method, the value of the argument will be TRUE. If using the US method, the value of the argument will be FALSE.

In the US method, if the starting date value is the 31st of the month, then this function will treat it as 30th of the month; if the ending date is the 31st of the month and the starting date is earlier than the 30th of the month, then the ending date becomes the first of the next month, else the ending date becomes the 30th of the same month.

In the European method, any date of 31st is treated as 30th of the month.

9.3.2. Time Functions

Similar to the date functions, there are some useful time functions as well.

NOW()

Like the TODAY date function, the NOW time function does not take any arguments. It simply returns the current system time into the cell, along with the date. Again, like with the TODAY function, you should note that the value stored in the cell keeps changing every time you open or calculate the sheet.

TIME(hour,minute,second)

Example: =TIME(A1,B1,C1)

Combines the time values for hour, minute, and second from different values or cells into a single cell. It's similar to the DATE

	A	B	C	D
1	Hour	Minute	Second	TIME Function
2	11	12	12	11:12:12 AM
3	12	34	56	12:34:56 PM
4	23	45	60	11:46:00 PM
5	26	0	0	2:00:00 AM
6	26	78	0	3:18:00 AM
7	26	78	85	3:19:25 AM

The TIME function with different values
