

TRUNC(number,num_digits)

If you want to just display the number to a specified number of decimal places without any rounding, you can use the Truncate function. If you want to simply specify just the portion without the decimal places (the integer portion), do not enter anything for the num_digits argument.

For example, when A1 = 2564897.5689456

=TRUNC(A1) will give the result 2564897

=TRUNC(A1,2) will give the result 256487.56

EVEN(number), ODD(number)

The EVEN and ODD functions round up the number to the next EVEN or ODD number.

For example, if A1 = 564.258

=EVEN(A1) will give the result 566

And

=ODD(A1) will give the result 565

POWER(number,exponential)

This is the same as using the caret sign (^) to calculate the exponential of a given number. For example: =2^8 and =POWER(2,8) will both give the result 256.

SQRT(number)

Calculates the square root of the number. Example: =SQRT(150) will give the result 12.2474487139159. You cannot use negative values with the Square Root function. If you do have a negative value whose square root you want to find, you'll need to use the absolute value function (ABS) to calculate it. Example: for a value of -234, you would enter

=SQRT(ABS(-234))
