

the other worksheet. Specify any custom Input Message and Error Alert messages you want to show your users and click OK.

The cell can be left blank without data entry if you select the Ignore Blank checkbox. If you clear this checkbox, you will be required to enter data.

In the List option, the “In-cell dropdown” option can be used to show an arrow when the user selects the cell. The user can then click on the cell and select the data from the drop-down list.

Finally, to minimise errors and to prevent your cells from being accidentally (or deliberately!) deleted, you can enable protection for your worksheet. To do this, first select the entire worksheet, right-click, and select Format Cells. In the Protection tab, select Locked, and click OK. Next, select the cells you’re going to allow users to edit. Open the Protection tab and clear the Locked tab. What this has effectively done is designate the entire worksheet as locked, with only the cells that users are allowed to edit being marked as unlocked.

Next, go to the Review tab, and in the Changes group, select Protect Sheet. In the resulting pop-up box, choose the actions that you will permit users to do on the worksheet, give a password for the protected sheet, and click OK. You can also leave it as a blank password but any user can unprotect the sheet without the password. The blank password is useful if you are more worried about forgetting the password and just want to prevent accidental data entry without being too concerned about security.
