

	A	B	C	D	E
1			3	4	5
2		=A2+1	=TABLE(A2,)	=TABLE(A2,)	=TABLE(A2,)

The formula location in a one-variable Row Data Table

will be B1. After the process is done, the cell range B6:G6 will be populated with the different Interest Values arrived at by changing the capital values listed in B5:G5.

Case 2: Two-Variable Data Table

To study the effect of simultaneous changes in Capital Amount and Rate of Interest on the Interest amount, we need to create a Two-Variable Data Table. In this case we can populate the cells A5:A10 with different Capital Amounts, and the cells B4:G4 with different Interest Rates. This relative position of the Row and Column is dictated by Excel. Excel also dictates that the formula has to be in the cell where the Input Row and Input Column meet, which in our case is the cell A4.

Now select the cell range A4:G10, and launch the Data Table tool. The Row input cell is B2 (Rate of Interest) and the Column Input Cell is B1 (Capital Amount). On completion, the cell range B5:G10 will be populated with the different Interest amounts.

	A	B	C	D	E	F
1						
2	=A1+6*B1	3	4	5	6	7
3	3	=TABLE(A1,B	=TABLE(A1,B	=TABLE(A1,B	=TABLE(A1,B	=TABLE(A1,B
4	4	=TABLE(A1,B	=TABLE(A1,B	=TABLE(A1,B	=TABLE(A1,B	=TABLE(A1,B
5	5	=TABLE(A1,B	=TABLE(A1,B	=TABLE(A1,B	=TABLE(A1,B	=TABLE(A1,B
6	6	=TABLE(A1,B	=TABLE(A1,B	=TABLE(A1,B	=TABLE(A1,B	=TABLE(A1,B
7	7	=TABLE(A1,B	=TABLE(A1,B	=TABLE(A1,B	=TABLE(A1,B	=TABLE(A1,B
