

sorting rows is not as easy. In the Sort Window obtained as mentioned earlier, click on the Options button. Here, set the Orientation to “From Left To Right”. By

Custom Lists in Excel

default, text sorting is not case sensitive; this behaviour, too, can be changed from the Options window.

A Custom List allows you to sort data in certain hierarchical order not already recognised by Excel. You'll realise the importance of this when you're sorting a column containing the names of the months. Normal sorting in ascending order would result in the names being arranged alphabetically with April ending on top. If you want to sort the names in ascending chronological order, which would end with January at the top, Excel needs to be informed about the hierarchy to be observed. The Custom List fulfils this purpose. Thoughtfully, Excel already has custom lists of the names of months and weekdays. This allows the columns containing either of this type of data to be sorted chronologically, besides alphabetically. If needed, you can also create a custom list. To use the Custom List as the sort key, this needs to be selected in the Sort Order field.

Sort options in the Header Row

Sorting options are also available on formatting a range of cells as a table. On the creation of a table, the Header Row cells will contain data controls offering Sorting and Filtering Options similar to those discussed earlier.
