

To be able to use this feature meaningfully, all columns in the range should have a Heading. The heading of the columns that will be used as the

condition has to be copied to another place, to be used as the Criteria Range. To specify a condition, the following rules apply:

Customer	Visits
=*a*	>100

The AND option in Advanced Filtering

A condition has to be a formula. Since simply entering a formula will cause Excel to execute it, the Formula must be circumscribed with quotes and prefixed with an equals sign (=). For example, to check for cells with a value greater than 10, the Criteria cell will contain the value

=>10"

To specify a compound condition with an AND, you use the same row. To specify a compound condition with an OR, you use a different row. For example, to filter cells under the title Cash

whose values are between 50 and 60, you create a Criteria Range with two columns having "Cash" as title, and insert ">50" and "<60" as values in the same row. To filter values less than 50 or greater than 60, you use the formulas "<50" and ">60" in the same column, in different rows. You can also create conditions for all columns simultaneously.

Customer	Visits
=*a*	= ">100"

Advanced Filtering OR option

4.2.3 Performing operations on Filtered Lists

Since entries in a filtered list are just hidden—they're not deleted—values of the hidden cells are also considered while performing operations or using functions on the range. To get around this problem, under the Find and Select button in the Editing block under the Home Tab, use the Go To Special link and enable "Visible Cells Only".
