

Drag and drop the columns from the main upper window into any of the four windows. As long as you keep the layout of the PivotTable report in mind, you will be able to logically decide on what needs to go where. You can experiment with different ways of viewing the data by moving the columns around and watching the data change dynamically. This way you will come across different ways in which the data can be viewed. Some will be ways you've never thought of before, or wondered about without an idea on how to extract the information from your raw data. Some selections will turn out to be meaningless, but you can create powerful and well-designed reports when you use the correct data elements in their correct places and apply the most appropriate formula.

5.2. Analysing Data With PivotTables

Selecting data fields

Explaining how to analyse data using PivotTables is best done with the use of an example. Note, however, that this explanation will be limited, and is more to give you an understanding of the depth and complexity in data analysis that you can achieve with PivotTables.
