

In our example, we have used the sales data for a Web hosting company's sales for October 2006 for their three departments: Web Design Sales, Web Hosting Sales, and Bandwidth Sales.

We can create a simple PivotTable report by clicking on the fields: Customer ID, Web Design Sales, Web Hosting Sales, and Bandwidth Sales. Excel will automatically make the following selections: Customer ID will be moved to the Row Labels, the Sum of Sales for the three departments will be shown in the Values area, with Values as the corresponding Column Labels. The result will be as in the figure below.

The report now shows the total sales for each customer for each department. You can change the Row labels to show sales by date by dragging the Date field to the Row Labels window. This will then show the data in a nested manner depending on which data element is first. If the Date field is below the Customer ID field then you can see the sales for each customer by their respective dates.

You can then collapse or expand the nesting by clicking on the "+" button next to each Customer ID. Nesting is a powerful function that enables you to combine two data fields in one view and

Nested Data
