

Report that shows the total count of the Customer ID A15 for sales from the three departments.

Finally, you can get a quick view of all the formulas in your PivotTable by clicking the List of Formulas option in the Formulas button in the Tools group. Advanced users can also get more fine-grained control by specifying the order in which you want the formula to be solved by using the Solve Order option in the same Formulas button drop-down.

5.3. Editing And Formatting PivotTables

You cannot directly edit the cells in a PivotTable, but you can change the values in the source data, refine the formulas, and rearrange the data using the Report Filters, Column Labels, etc. Once you've made the changes, you can refresh the PivotTable by right-clicking and selecting Refresh to get the revised data.

Once you have the data and all the elements you require, you can format your PivotTable to make it look attractive and enhance its readability. Using charts is one way to present the data in a visual form that is easily accessible to the users. To create a chart, click on the PivotChart button under the Options tab. Choose the chart type and click OK. You can use the PivotChart Filter Pane to adjust the look and feel of your graph.

Other than PivotChart, you can apply different kinds of formatting to the PivotTable itself that will improve its look and feel in print or other reports.

One option is to manually format the PivotTable, an individual cell or a cell range in the table using the Format cells option when you right click. This option will enable you to control the formatting exactly as you want it. Note, however, that the Merge Cells option in the Alignment tab will not work in a PivotTable report.
