

create customised connections and queries to relational database systems.

You can also import data from text files, Access databases and even directly from the Web. Of these, the ability to directly import from the web is a brand new feature.

Simply click on the From Web button and type the URL of the address you wish to use in the dialog box.

Import Data from the Web

The window will access the Web like a regular browser but with a difference: a special yellow arrow highlight will tell you what you can import into Excel. Select the sections you want to see in Excel by clicking on it. The yellow arrow will change to a green tick-mark. Once you are satisfied with your selection, click Import. Excel will ask you where you want to put the data. Choose the required location and click OK. The import function may not however work uniformly with all sites—especially sites where data is being dynamically generated from a database every time you access it. You can also specify additional conditions like background refresh where the data will be kept synchronized with the website. This of course, assumes that you have an always-on Internet connection.
