

Trends and patterns in data can be observed from charts, trends which might go unnoticed from numbers in a worksheet. For instance, if you have a table with two or more data series, you can use charts to quickly draw inferences from it. If used wisely, charts can give a comprehensive overview of worksheet data.

6.1 The Chart Group

The Chart group consists of over all eleven types of charts, each

The Chart group in Excel 2007

with its sub-types. To view the Chart group, click on the Insert tab or press [Alt] + [N].

Charts and worksheets go hand in hand with spreadsheets when looking for trends or patterns in your data. Choosing the right chart is completely dependant upon the type of data in your worksheet. You can use a particular set of numerical data to check out all the chart types, most commonly, worksheets that have two data series. Worksheets with more than two data series cannot be used with all chart types.

Excel gives you a number of options to manipulate your chart for optimum representation of your data. Unfortunately, no new chart types or features have been added in the step up to Excel 2007 from 2003.

6.2 Types Of Charts

Records of daily expenses, the inventory of a storehouse, sales figures, estimated expenses on construction, the records of marks in examinations, etc., can be used to make charts.
