

Within 3D, there is only one sub-type that uses data series with 3D effects. But this sub-type does not display it very well. 2D has six sub-types listed under the menus, which are further sub-listed into “With Markers” and “Without Markers”.

Of these, the latter displays trends over time, or other categories, while the former displays the contribution of each value over time or other categories. A third has a 100% stacked line that displays the trends of percentage that each value contributes over various categories and time.

6.2.3 The Pie chart

A Pie Chart is used on one data series to display relative proportions or contributions to a whole. This type contains six sub-types, classified into 2D and 3D.

In the 2D sub-type, the first is like a normal pie, displaying the contribution of each value; the second is an exploded pie with the pieces apart. Then there is a small pie made from a larger pie chart, and a bar graph representation of a pie chart containing details of each slice. 3D has two sub-types; one has all the data series held together, while the other has an exploded pie with data values in shape of slices.

The Pie chart options

Emphasis can be placed on a particular slice of the chart by using different colours, broad patterns, or by labelling them. Remember, in a pie chart, only positive values are allowed—using negative values will just convert them to positive integers.
