

6.2.4 The Bar chart

Bar charts have fewer sub-types than Column charts, with five categories: 2D bar, 3D bar, cylinder, cone, and pyramid. Each sub-type has three different ways of being represented: bars of different values adjacent to each other, data values stacked over each other, or data values stacked over each other with a 100% stacked bar.

6.2.5 The Area chart

Area charts are similar to line charts, but the area between the lines is filled in with separate colours. In this type of chart, the emphasis is more on the magnitude of values and less on changes over time.

Area charts has two categories: 2D and 3D display. In the 2D type, you will find three sub-types: data values plotted with area fill, stacked area fill, and data values plotted on a 100% stacked area.

6.2.6 Scatter Chart

Scatter charts are best suited for showing the correlation between data values that might not be easily observed. For example, for data series like expenditure, sales, insurance, etc., this type of chart is an apt choice.

Both the axes on the chart have numeric values and a legend field. The five sub-types can be used to display correlation using the different variations.

The sub-types of the Scatter chart are Markers, Smooth Lines & Markers, Straight Lines & Markers, Smooth Lines, and Straight Lines.
