

- Specific types of interfaces
- Services
- ICMP and ICMPv6 by type and code
- Source and destination IP addresses
- All TCP or UDP ports, or specified ports

Windows Vista creates a firewall profile for each network that you connect to. Future connections to that network then invoke the saved profile. Thus when you connect to a new net-

Windows Firewall Connections

work, Vista will ask you to identify the same and categorise it as either Public (asking for greater protection), or as Private (which calls for slightly relaxed rules). Windows Firewall will then modify rules accordingly. To change this profile, go to **Start > Control Panel > Network and Internet > Network and Sharing Center**, and then click on **Customize** next to the name of the network to which you are connected.
