

Search right there in Explorer

log boxes, such as the Open file dialog. Searching is quick and is exposed by default as a simple query, which can, however, be extended to search on the basis of multiple variables such as filename, tags, authors, location, date, size, and whether the search should extend beyond the indexed locations.

Also available is a Search Pane, which offers quick filtering options to the search results on the basis of file types. Thus, if you run a search on “kittens”, the tool will return all results under your indexed locations—you can then filter the results by clicking on “Picture”, which will only show pictures with the term “kitten”, or alternatively choose to show only e-mails exchanged with the word kitten in them by clicking “E-mail”, and so on.
