

- The Desktop is part of the Finder. Clicking on the desktop makes the Finder active at any time.
- Each user account created on a Mac has an individual desktop. To see the contents of the Desktop in a Finder window, open the home folder, then click Desktop.
- The Desktop background picture can be changed. Open System Preferences and click Desktop & Screen Saver.

6.1.5 How Is The Disk Organised?

Mac OS X is organised to help the user find things quickly and easily. The Finder window sidebar provides a convenient place to start understanding how the disk is organised.

- The top area of the sidebar shows disks. One of the disks is the startup disk, the disk with the Mac OS X software. If a Mac's disk has been divided into separate sections, called "volumes" or "partitions," you will see them as well. You will also see other disks, CDs, and DVDs being used.
- If a Mac is connected to a network, you can click Network in the sidebar to locate servers and other computers on the network.
- On turning iDisk syncing ON in .Mac preferences, the iDisk appears in the top area of the sidebar.
- Most Mac OS X applications are in the Applications folder on the startup disk. Clicking on the Applications icon in the sidebar opens this folder.
- Each user has a "home" folder, a convenient and private place to keep their personal files and software. It can be seen in the sidebar.
- Inside a home folder, there are folders named Documents, Movies, Music, and Pictures, to hold the user's personal files. Other folders can be created to organise files any way the user likes. To create a new folder, choose **File > New Folder**. To put a file in a folder, drag the file.
- If Personal File Sharing is turned on (in Sharing preferences) and the Mac is on a network, the Public folder in the home folder is available to other users on the network. It can be used to exchange files with them.
- The Library folder in the home folder contains fonts and other
