3.5 The MacBook

Like its elder sibling, the MacBook has a rich history as well. The Macbook was first introduced as iBook in 1999. The iBook served Macintosh users for about seven years before Apple switched to Intel processors, and replaced iBook with MacBook.

As we’ve said before, the iBook was first introduced in 1999. The target market of the iBook G3 was students, families, and other individuals who needed a lower-priced notebook, without the frills of the Powerbook. At that time, Apple’s computer line sorely missed a laptop targeted at consumers. The Powerbook was a fine bit of machinery, but it was way too expensive for home users. Apple recognized this hole in their laptop line-up, and on 21st July 1999, Steve Jobs introduced the iBook G3 at the MacWorld conference.

The design of the iBook G3 was influenced by the iMac of those days. The iBook G3 was also the first mainstream computer to feature inbuilt wireless networking.

By the early 2000s, the iBook design had gotten a bit dated.
