

marks, another one that stops a Web page from loading and changes to the reload button when the loading is complete, back and forward buttons, and a bookmarks button to browse through your bookmarks. The address bar itself functions as the status bar while a page is loading.

The full-featured browser shows promise

The default page is, of course, Apple's official site. The magic starts when you open a Web page. It is not a WAP version of the page, or any version that is compromised in any manner—it is the whole page as you would see it on a computer screen. Turn the phone on its axis and it switches to landscape mode, which makes for a better Web browsing experience on most sites.

Scrolling across a Web page is done with the same flick action used throughout the interface. Since the phone loads the whole Web site onto a tiny 3.5 inch screen, the text on most sites becomes very small and illegible. So you can get in with your fingers and pinch it, but there is an optimisation here—you can simply double tap on anything and it automatically fills up the screen with it. You can simply zoom in and scroll around and zoom in

Again, the orientation changes when you rotate the phone
