

### 3.1.6 The Review Tab

This is where you put the final touches to your presentation's content—do a spell-check, and use the thesaurus if you want fancier words. If you're going over someone else's presentation, use this tab to add comments without changing the original content of the presentation. Finally, you can also protect presentations from unauthorised editing here.

Use the view tab to see what your presentation will look like on a greyscale printer

### 3.1.7 The View Tab

Use this tab to choose different layouts for your PowerPoint interface. You can also use it to view your slides in greyscale or Black & White—handy if you intend to print and/or photocopy them.

Use this tab if you're an advanced user

### 3.1.8 The Developer Tab

If you plan on using and writing macros, you'll need to enable the Developer tab: go to the **Office Button** > **PowerPoint Options** > **Popular**, and select Show the Developer Tab in the Ribbon. Now you can access a bunch of ActiveX Controls to create forms, and Visual Basic to write your macros.

In addition to all these tabs, you'll find custom tabs popping up now and then to show you what you can do with a particular object—you'll see a Format tab every time you select a text box, for instance.
