

PowerPoint 2007: Modifying the Fill effect for the Title layout slide master

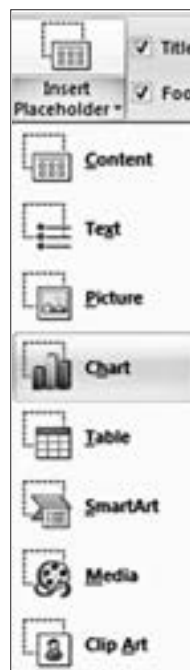

PowerPoint 2007, you are not restricted so. Each layout can contain as many placeholders as you see fit.

Typically, rather than build a Slide / Title Master pair (PowerPoint 2003) from scratch, you would use a design template to apply pre-formatted graphics and

other design elements to your presentation. This saves time. While it is advisable to format your slide master first and then adjust the contents, you can also apply pre-defined masters to existing slides. This you would normally do by applying one or more design templates to an existing presentation. See §5.5 to learn how to create, modify, and apply design templates.

In PowerPoint 2007, design templates have been replaced with Themes, which have a much broader scope. See Chapter 12 to learn more about Themes.

An important point to note: the special formatting, graphics, colour themes, images, and backgrounds that you add to your masters will appear in your presentation only if the specific layout, title, or content slide is selected. For example, if you have two slide masters in PowerPoint 2003 and one of them contains a graphic logo, you will be unable to see the logo if you choose the wrong slide in the design template pane.

PowerPoint2007: Go wild with placeholders!
