

the priority, we advise you use sans-serif fonts such as those of the Arial family (the most commonly used sans-serif font for windows)—such as Arial, Arial Unicode MS, Arial Black, Arial Narrow or Arial Rounded MT Bold.

Type of font	How it looks	What's great about it	What's not so great about it
Arial	This is how Arial looks	Readable, clear and the most popular. Recommended universally as the best font for PowerPoint.	Everybody's using it (but we still recommend it).
Comic Sans MS	This is how Comic Sans MS looks	Readable. Sometimes used in informal presentations.	A bit enticing to read text in this font in slide after slide. Not preferred, even though recommended by some.
Gigi	This is how Gigi looks	Fun. Eye-catching. Giggly.	Pretty much a strain if you've got to read a large chunk of text in Gigi. Remember, it's more a display font than a content one.
Lucida Handwriting	This is how Lucida Handwriting looks	One of the most respectable "handwriting" fonts. Decent, elegant, legible.	Great as a caption font or in large font size, virtually ineffective if font size goes below a font size of 24.
MS Reference Sans Serif	This is how MS Reference Sans Serif Looks	Ultra clean, stark, traditional and non-controversial.	A lot of slides full of MS Reference Sans Serif text is liable to leave a drab and dreary effect. Definitely a no-no for captions for pictures or eye-catching slogans.
Times New Roman	This is how Times New Roman looks	More stylish than Arial. The quintessential font for print.	The Serif has been found to interfere with the legibility of text on a screen. Not advisable for screens, though really odd for handouts.
Cambria	This is how Cambria looks	Has the serif, but still looks great on screen.	Really good for headings, but does not give optimal results for large paragraphs of text.
Calibri	This is how Calibri looks	This is the Default font in PowerPoint 2007. With good reason.	Lacking in style. If you're keen on giving a presentation with pizzazz, this one falls a little short.
Rave	This is how Rave looks	Wacky. Exciting. Informal. Young.	Doesn't work for the "prim and proper" crowd

Here's a Quick View of some typical fonts and what's hot about them—and what's not

Arial is, what is known as, as a "Content" font, because it is one of the conventional, easy-to-read fonts that improve the readability quotient of text, specially if you have larger chunks of text on a single slide (Arial, Times New Roman, Cambria, Calibri, etc. are all Content fonts). "Display" fonts, on the other hand are eye-catch-
