3.5.7 Hand Held Scanner

These are smaller scanners that rely on the user's movement to scan the document below it. These can be in the form of Bar Code Scanners which are used to record bar codes on packages or as Pen scanners where moving the scanner over the document captures its contents.

3.5.8 Interpolated Resolution

If the hardware is unable to produce the resolution, the software can interpolate the values of two points to arrive at the values of a point in between them. This would be the interpolated resolution. Scanners achieve a higher resolution by Interpolation.

3.5.9 Negative Scanners

These scanners are used to scan photographic film negatives. In these scanners the optical sensor and the light source are on opposite sides of the scan subject. The scan result is the developed photo.

3.5.10 OCR

Optical Character Recognition refers to the process of identifying textual data present in an image file. All scanners come with a bundled OCR software. Good OCR software can identify textual and graphical data and retain the formatting of the original document. For best results, OCR software need a scanning resolution higher than 200 dpi.

3.5.11 Optical Resolution

If the resolution can be achieved by the hardware, it is the optical resolution. Optical resolution is the product of the number of
