

4.3.6 RMS

Root Mean Square is the average power output rating of a speaker, and is considered a more accurate indicator of a speaker's capability than PMPO. The total RMS of a system will be the sum of the RMS of all speakers in the system.

4.3.7 Amplifier

This is the circuitry that amplifies (increases) weak electrical signals so that they can be output through larger speakers. Most headphones do not have amplifiers and rely on the amplifier of the sound card to generate the sound. Larger speakers have their own amplifiers since the sound card doesn't have adequate power.

A 2-way speaker with tweeter and woofer

4.3.8 Satellites

In any multichannel speaker system, the small speakers that offer directional audio are called the satellites. These are usually placed around the listener.

4.3.9 SNR

Signal to Noise Ratio is the difference between the sound played back and the accompanying noise created by equipment interference. It is an indicator of the quality of components used in the speaker system, since higher-quality components tend to cause less interference. It is expressed in decibels, and the greater the SNR, the less the adulteration by noise.
