

Comments

Xana is an impressive NG reader. Displaying the number of topics/messages alongside the list of NGs in the server would aid identifying the level of activity in an NG without having to subscribe to it. But this is a very minor complaint.

Configure your Xana options

7.1.3.2 40tude Dialog (4D)

Usage

At first launch, a wizard will guide you in configuring the application. For some strange reason, the application will not accept domain names with 2 letters only. Besides that minor irritant, the installation is smooth. If needed, 4D can also be

The 4D interface

used as an e-mail client and the relevant information like POP3 server address, etc., can be entered. The wizard will ask to download all NGs in the server when the configuration is over.

The list of NGs in the server is displayed along with the new messages in each under the All tab in the top left pane. The message count makes it easier to identify the more active NGs, since there is nothing worse than ending up subscribing to a ghost NG. Under the Filtered tab, you can shortlist NGs based on the presence of the search term in their names. You can sample the headers in an NG without subscribing to it. To subscribe to an NG a double-click suffices. Headers in an NG can be downloaded by selecting the NG and using the Get New headers in the
