

tection, data storage, and to top it all, an option to save it either in .rtf, open office, .zip, Word, and even .pdf formats. Another important function here is that these documents can be shared online. Data could be added by your chosen users—all you need to do is invite them to use this document. You can set their privileges similar to the way you do for a shared folder in Windows—for example, deciding on who gets permission to read and who gets permission to write. This speeds up the process of data compilation from multiple sources, yet maintaining security. The Insert tab lets you insert objects to make your document more lively.

The Revisions tab keeps a track of every change made to your document—both by you and those who you have shared your document with. That's the best part, because as the owner of this document, you can then track any error that may have crept in and isolate it, without having to correct other areas of the document. For example, if you first typed a word, a friend deleted it and then a second friend added it again. You may have been (verbally) informed of the deletion, but not of the re-addition. You would get all the relevant information from the revisions tab along with a time stamp. To the right hand side of the page, are two vital tabs, namely, Share and Publish. Click on the Share tab to share your document.

As you would see, from the window, there are two options: “as collaborators” and “as viewers”. Collaborators are those with special privileges to change the data just like you, while viewers are those who have no permission to write, but rather just read. Let us con-
