

Use the Hue / Saturation dialog to correct the tone of your image

A Bit Of Colour Correction

We'll continue with the image that we get after applying the Levels adjustment—the image still has more blue than we'd like. For this, we turn to the Hue / Saturation dialog.

At the bottom of the dialog, you'll find two colour bars. When you drag the Hue slider, the bottom bar moves, and the colours in the image that correspond to the top bar get replaced by the colour directly below on the bottom bar. For example, if you drag the Hue slider so that the yellow region of the bottom bar is below the red region of the top, then the reds in the image will be replaced by yellows. This is good if your image is filled with a colour it's not supposed to be.

You can also use this dialog to tone up or down any colour that seems to be dominating (or missing from) your image. From the drop-down, select the colour you want to manipulate—Yellows, for example. When you use the Saturation slider now, you'll see the intensity of the yellows in the image increase or reduce.
