

### A Closer Look

In order to get a feel of layer blending modes, the basic requirement is a couple of images on two layers. For this exercise, we will use two images. The image at the base layer is the star-shaped image, while the spiral-shaped image is on the upper layer. This base image is in Normal mode at 100 per cent opacity. The other layer is placed above the base image. We will apply all changes to this layer, especially effects like half-opacity.

You can carry out your operations on the specific layer with this menu.

### Normal

When a pattern is set at normal mode and 100 per cent opacity, we wouldn't see the shape image at all. To get a glimpse of the base layer, you have to reduce the opacity of the upper layer. After reducing the opacity of the upper layer to 50 per cent, which effectively means half transparency, the base layer begins to show up.

Reducing the opacity of the upper layer makes the base layer to show up

### Dissolve

In order to use Dissolve, the opacity of the top layer should be less than 100 per cent.

### Multiply

A colour in an RGB image is made of three colour channels, each
